

# Equine Wound Case Report

Below are some amazing photos of a severe wound on a horse treated with only the Assisi Loop. The owner of the horse is a Dr Aurelio Chau, a retired thoracic surgeon at Cedar Sinai Hospital in Los Angeles. He now resides on his horse farm with his family in Ocala, Florida.

*"The colt Retorno de Maria was taken out of his stall and placed with two other colts in a pasture paddock. He was kicked in the leg and the injury was discovered after 48 hours; for this reason the wound was considered infected (or at least contaminated) and the decision was made not to suture the skin and instead to wash the wound thoroughly, cover it with antiseptic ointment and wrap the leg. Treatment with the Asisi was started the same day the wound was washed and wrapped (Photos 12/30/09). Treatment was given with the Asisi twice a day for 25 minutes for 5 days. The device was used in the manual mode and removed after 25 minutes of treatment. **The leg was wrapped for the first two days of treatment only and the colt received no other treatment or medications.** After the initial two days the wound was left open and unraped (photos taken 01/02/10), the inflammation and edema had decreased significantly. I left to go to LA and when I came back asked about the colt and was told by David and Janine that the colt had not received any other treatments or meds since the time I left. Unfortunately no other photos were taken until the ones on 01/31/10. to my surprise the wound had healed completely and the remaining scar is small, there is no residual pain and movement in the leg is normal."*

Aurelio.
